XSL Formatter   axf:line-continued-mark
  fo:block   "-"

An XSL stylesheet processor accepts a document or data in XML and an XSL-
stylesheet and produces the presentation of that XML source content that was-
intended by the designer of that stylesheet.
There are two aspects of this presentation process: first, constructing a result tree-
from the XML source tree and second, interpreting the result tree to produce-
formatted results suitable for presentation on a display, on paper, in speech, or onto-
other media.
The first aspect is called tree transformation and the second is called formatting. The-
process of formatting is performed by the formatter. This formatter may simply be a-
rendering engine inside a browser.
